Part 3: Service Definition and Value Help

1. Exposing the Service

The Service Definition exposes our CDS views as an OData service.

- `expose ZIW_Products;`

2. Adding Value Help

To provide a dropdown for the **Currency** field, we need a source of truth.

- We use the standard view `I_Currency` .
- **Crucial Step:** We must `expose I_Currency` in the Service Definition so the UI can access it.

3. Linking the Value Help

In the CDS view (`ZIW_Products`), we add the annotation:

```
@Consumption.valueHelpDefinition: [{ entity: { name: 'I_Currency', elemer
prd_currency
```

This tells the UI: "When the user edits `prd_currency` , show a list from `I_Currency` ."
